25	Spectral algorithms form a general framework that unifies many regularization schemes
26	in learning theory. In this paper, we propose and analyze a class of thresholded spectral
27	algorithms that are designed based on empirical features. Soft thresholding is adopted
28	to achieve sparse approximations. Our analysis shows that without sparsity assumption
29	of the regression function, the output functions of thresholded spectral algorithms are
30	represented by empirical features with satisfactory sparsity, and the convergence rates
31	are comparable to those of the classical spectral algorithms in the interature.
32	Keywords: Learning theory; thresholded spectral algorithm; sparsity; learning rate.

### 1. Introduction and Main Results 34

Consider a regression problem modeled by an unknown probability measure  $\rho$  on 35 the product space  $X \times Y$  of some compact metric (input) space X and output space 36  $Y \subset \mathbb{R}$ . Given a training sample  $\mathbf{z} = \{(x_i, y_i)\}_{i=1}^m$  drawn independently from  $\rho$ , the 37

1

regression problem aims at approximating the regression function defined by

$$f_{\rho}(x) = \int_{Y} y d\rho(y|x), \quad x \in X,$$

where  $\rho(\cdot|x)$  is the conditional distribution of  $\rho$  at  $x \in X$ . We consider approxima-2 tions provided by regularization schemes in reproducing kernel Hilbert spaces. 3

A classical well understood learning algorithm is the regularized least squares, 4 and there is a large literature on error analysis for this algorithm, see e.g. [24, 6, 5 6 21, 18, 19, 17]. Recently, optimal learning rates (minimax rates of convergence) for this classical learning algorithm are established in [15]. The regularized least 7 squares algorithm suffers from the so-called saturation phenomenon [16]. Spectral 8 algorithms introduced in [9, 16] with motivations from regularization methods in 9 learning theory and inverse problems can overcome the saturation phenomenon. A 10 spectral algorithm is defined in terms of a Mercer kernel  $K: X \times X \to \mathbb{R}$  (which is a 11 continuous, symmetric, and positive semi-definite function) and a filter function  $g_{\lambda}$ : 12  $[0, \kappa^2] \to \mathbb{R}$  with a parameter  $\lambda > 0$ , where  $\kappa := \max\{1, \sup_{x \in X} \sqrt{K(x, x)}\}$ . The 13 regularized least squares algorithm is included in the family of spectral algorithms 14 [1, 16] with filter function  $g_{\lambda}(\sigma) = \frac{1}{\sigma + \lambda}$ . Some other members in this family include 15 the Landweber iteration (or gradient descent [23]) with the filter function  $g_{\lambda}(\sigma) =$ 16  $\sum_{i=1}^{t-1} (1-\sigma)^i$  parameterized by  $\lambda = \frac{1}{t}$  for an integer  $t \in \mathbb{N}$ , and spectral cut-off 17 with filter function  $g_{\lambda}(\sigma) = \frac{1}{\sigma}$  if  $\sigma \ge \lambda$ , and  $g_{\lambda} = 0$  otherwise. Spectral algorithms 18 were well studied for regression in learning theory, see e.g. [16, 1, 7, 4, 8]. Recently, 19 optimal learning rates of spectral algorithms for regression are derived in [11] by a 20 new error decomposition technique and a second order decomposition approach. We 21 refer the reader to [1, 11] and reference therein for more details about the spectral 22 algorithms. 23

Along a different direction, learning algorithms producing sparse approxima-24 tions have attracted much attention within the last decade. Besides the spectral 25 cut-off in the family of spectral algorithms, the  $\ell^1$ -regularizer often leads to spar-26 sity, which has been observed in the LASSO algorithm [20, 25, 26] and in com-27 pressed sensing. Recently, empirical feature-based  $\ell^1$  regularization was proposed 28 in [12]. Given the sample z, empirical features are a set of functions  $\{\phi_i^x\}_{i=1}^{\infty}$  on X, 29 based on  $\mathbf{x} = \{x_i\}_{i=1}^m$  (to be defined below). The output function of the empirical 30 feature-based  $\ell^1$  regularization algorithm is represented by  $\sum_{i \in \mathbb{N}} c_{\gamma,i}^{\mathbf{z}} \phi_i^{\mathbf{z}}$  with the 31 coefficients  $\{c_{\gamma,i}^{\mathbf{z}}\}_{i=1}^{\infty}$  given by a coefficient-based  $\ell^1$  regularization algorithm. The 32 algorithm is a modification of the kernel projection machine (KPM) introduced in 33 [2] and analyzed in [27]. Sparsity and error analysis of this algorithm for regression 34 are investigated in [12]. It is valuable due to the satisfactory learning rates and 35 strong sparsity under a mild condition and without any sparsity assumptions on 36 37 the regression function. Empirical feature-based algorithms with sparse properties induced by concave regularizers for regression are studied in [10] recently. 38

Motivated by the spectral algorithms and the empirical feature-based  $\ell^1$  regu-39 larization algorithm, we propose a new learning algorithm associated with a filter 40

1 function  $g_{\lambda}$  and soft thresholding function  $G_{\gamma}$  which provides satisfactory learning 2 rates for regression and strong sparsity without any sparsity assumption about the 3 regression function. We first define the filter function  $g_{\lambda}$  and the soft thresholding

4 function  $G_{\gamma}$  as follows.

5 **Definition 1.1 (Filter function).** We say that  $g_{\lambda} : [0, \kappa^2] \mapsto \mathbb{R}$ , with  $0 < \lambda \leq \kappa^2$ , 6 is a filter function with qualification  $\nu_g \geq \frac{1}{2}$  if there exists a positive constant b 7 independent of  $\lambda$  such that

$$\sup_{0<\sigma\leq\kappa^2}|g_{\lambda}(\sigma)|\leq\frac{b}{\lambda},\quad \sup_{0<\sigma\leq\kappa^2}|g_{\lambda}(\sigma)\sigma|\leq b,\quad\forall\,0<\lambda\leq\kappa^2\tag{1}$$

8 and

$$\sup_{0 < \sigma \le \kappa^2} |1 - g_\lambda(\sigma)\sigma| \sigma^\nu \le c_\nu \lambda^\nu, \quad \forall \, 0 < \nu \le \nu_g, \quad 0 < \lambda \le \kappa^2, \tag{2}$$

9 where  $c_{\nu} > 0$  is a constant depending only on  $\nu \in (0, \nu_q]$ .

10 **Definition 1.2 (Soft thresholding function).** The soft thresholding function 11  $G_{\gamma} : \mathbb{R} \mapsto \mathbb{R}$  with a thresholding parameter  $\gamma > 0$  is defined as

$$G_{\gamma}(\sigma) = \begin{cases} 0, & \text{if } |\sigma| \le \frac{\gamma}{2}, \\ \sigma - \frac{\gamma}{2}, & \text{if } \sigma > \frac{\gamma}{2}, \\ \sigma + \frac{\gamma}{2}, & \text{if } \sigma < -\frac{\gamma}{2}. \end{cases}$$
(3)

12 Let  $(\mathcal{H}_K, \langle \cdot, \cdot \rangle)$  with the norm  $\|\cdot\|_K$  be the reproducing kernel Hilbert space 13 (RKHS) generated by the Mercer kernel. To define empirical features  $\{\phi_i^{\mathbf{x}}\}_i$ , we 14 need the empirical integral operator  $L_K^{\mathbf{x}}$  on  $\mathcal{H}_K$  associated with the kernel K and 15 the input data  $\mathbf{x} = \{x_1, \ldots, x_m\}$  given by

$$L_K^{\mathbf{x}}(f) = \frac{1}{m} \sum_{i=1}^m f(x_i) K_{x_i}, \quad f \in \mathcal{H}_K,$$

$$\tag{4}$$

where  $K_x$  is a function in  $\mathcal{H}_K$  defined by  $K_x(u) = K(x, u)$ . Recall the reproducing property  $\langle f, K_x \rangle = f(x)$  for any  $f \in \mathcal{H}_K$ . Let  $\{(\lambda_i^{\mathbf{x}}, \phi_i^{\mathbf{x}})\}_i$  be a set of normalized eigenpairs of  $L_K^{\mathbf{x}}$  with the eigenfunctions  $\{\phi_i^{\mathbf{x}}\}_i$  forming an orthonormal basis of  $\mathcal{H}_K$ , then the functions  $\{\phi_i^{\mathbf{x}}\}_{i=1}^{\infty}$  are called empirical features which can be computed explicitly [2, 12] by the eigenpairs of the Gramian matrix  $(K(x_i, x_i))_{i,j=1}^m$ . Denote

$$f_{\rho}^{\mathbf{z}} = \frac{1}{m} \sum_{i=1}^{m} y_i K_{x_i}.$$
 (5)

Definition 1.3 (Thresholded spectral algorithms). A thresholded spectral algorithm for sparsity associated with a filter function  $g_{\lambda} : [0, \kappa^2] \mapsto \mathbb{R}$  and a soft

 $4 \quad Z.\text{-}C. \ Guo \ et \ al.$ 

1 thresholding function  $G_{\gamma} : \mathbb{R} \mapsto \mathbb{R}$  is defined by

$$f_{\mathbf{z}} = g_{\lambda}(L_K^{\mathbf{x}}) \sum_{i \in \mathbb{N}} G_{\gamma}(\langle f_{\rho}^{\mathbf{z}}, \phi_i^{\mathbf{x}} \rangle) \phi_i^{\mathbf{x}} = \sum_{i \in \mathbb{N}} c_{\lambda,\gamma,\mathbf{z}}^i \phi_i^{\mathbf{x}}, \tag{6}$$

where  $g_{\lambda}(L_K^{\mathbf{x}})$  is the operator on  $\mathcal{H}_K$  defined by spectral calculus as  $g_{\lambda}(L_K^{\mathbf{x}}) = \sum_i g_{\lambda}(\lambda_i^{\mathbf{x}})\phi_i^{\mathbf{x}} \otimes \phi_i^{\mathbf{x}} = \sum_i g_{\lambda}(\lambda_i^{\mathbf{x}})\langle \cdot, \phi_i^{\mathbf{x}} \rangle \phi_i^{\mathbf{x}}.$ 

**Remark 1.4.** If we replace the thresholding function  $G_{\gamma}$  by the identity function (which is the limit of  $G_{\gamma}$  as  $\gamma \to 0^+$ ), the thresholded spectral algorithm (6) is reduced to the ordinary spectral algorithm  $f_{\mathbf{z}} = g_{\lambda}(L_K^{\mathbf{x}})(\frac{1}{m}\sum_{i=1}^m y_i K_{x_i})$  that is studied in [1, 16].

8 If we replace the filter function  $g_{\lambda}(\sigma)$  simply by the reciprocal function  $1/\sigma$ 9 (which is no longer a filter function, but could be regarded as the limit of  $g_{\lambda}$  if we 10 push  $b \to \infty$  in (1) and  $c_{\nu} \to 0^+$  in (2)), the thresholded spectral algorithm (6) is 11 reduced to the empirical feature-based scheme studied in [12].

12 Let  $\rho_X$  be the marginal distribution of  $\rho$  on X and  $(L^2_{\rho_X}, \|\cdot\|_{\rho})$  the Hilbert 13 space of  $\rho_X$  square integrable functions on X. Define the integral operator  $L_K$  on 14  $\mathcal{H}_K$  associated with the Mercer kernel K by

$$L_K(f) = \int_X f(x) K_x d\rho_X, \quad f \in \mathcal{H}_K.$$

15 Our error analysis is based on the following regularity condition

$$f_{\rho} = L_K^r(u_{\rho}) \quad \text{for some } r > 0 \quad \text{and} \quad u_{\rho} \in \mathcal{H}_K,$$
(7)

where  $L_K^r$  denotes the *r*th power of  $L_K$  on  $\mathcal{H}_K$  since  $L_K : \mathcal{H}_K \to \mathcal{H}_K$  is a compact 16 and positive operator. The eigenvalues  $\{\lambda_i\}$  of  $L_K$  are arranged in a nonincreasing 17 order and its corresponding normalized eigenfunctions  $\{\phi_i\}_i$  form an orthonormal 18 basis of  $\mathcal{H}_K$ . Condition (7) is equivalent to  $f_{\rho} = L_K^r u_{\rho} = \sum_{j \in \mathbb{N}} \lambda_j^r d_j \phi_j$  with  $u_{\rho} =$ 19  $\sum_{j\in\mathbb{N}} d_j \phi_j$  and  $\|u_{\rho}\|_K = \|\{d_j\}\|_{\ell^2}$ . Throughout the paper we assume  $|y| \leq M$ 20 almost surely for some constant M > 0. It would be interesting to extend our 21 analysis to more general situations by assuming exponential decays for  $f_{\rho}(x) - y$  or 22 some moment conditions [3, 13]. 23

To illustrate our general analysis (stated in Theorem 4.1 below) on sparsity and learning rates for the thresholded spectral algorithm (6), we state the following result in a special situation when the eigenvalues  $\{\lambda_i\}_{i=1}^{\infty}$  of  $L_K$  decay polynomially.

Theorem 1.5. Suppose that regularity condition (7) holds with some  $0 < r \le \nu_g$ and the eigenvalues  $\{\lambda_i\}$  of  $L_K$  decay polynomially as

$$D_1 i^{-\alpha} \le \lambda_i \le D_2 i^{-\alpha}, \quad \forall i \in \mathbb{N}$$
 (8)

29 with  $\alpha > 1$  and  $0 < D_1 \leq D_2$ . Let  $0 < \delta < 1$ . If we choose

$$\gamma = C_0 \left(\frac{D_2}{\kappa^2 + 1}\right)^{r+1} \left(\log\frac{6m}{\delta}\right)^{r+1} m^{-\frac{r+1}{\max\{2, 2r+1\}}}$$
(9)

1 and

$$\lambda = \begin{cases} m^{-\frac{1}{2} + \frac{1}{4\alpha(1+r)}} & \text{if } 0 < r \le \frac{1}{2}, \\ m^{-\frac{2\alpha(r+1)-1}{2\alpha(2r+1)(r+1)}} & \text{if } r > \frac{1}{2}, \end{cases}$$
(10)

then with confidence at least  $1 - \delta$ , we have 2

$$c_{\lambda,\gamma,\mathbf{z}}^{i} = 0, \quad \forall i \ge m^{\frac{1}{\alpha \max\{2,2r+1\}}} + 1$$
 (11)

and3

$$\|f_{\mathbf{z}} - f_{\rho}\|_{\rho} \le C \left(\log \frac{6m}{\delta}\right)^{\max\{r+2,\frac{5}{2}\}} m^{-\theta},$$

where4

$$\theta = \begin{cases} \frac{2r+1}{4} - \frac{1}{4\alpha} & \text{if } 0 < r \le \frac{1}{2}, \\ \frac{1}{2} - \frac{1}{2\alpha(2r+1)} & \text{if } r > \frac{1}{2}, \end{cases}$$
(12)

and the constants  $C_0, C$  are independent of m or  $\delta$ . 5

**Remark 1.6.** Our learning rate index  $\theta$  can be of type  $\frac{1}{2} - \epsilon$  with an arbitrarily 6 7 small  $\epsilon > 0$  when the regularity parameter r in condition (7) is large enough. Note that condition (8) is satisfied by Sobolev kernels on domains of Euclidean spaces 8 for which  $\alpha$  depends on the smoothness index of the Sobolev space. Theorem 1.5 is 9 10 a corollary of Theorem 4.2 to be given in Sec. 4.

If the eigenvalues  $\{\lambda_i\}$  decay exponentially, we have the following result.

**Theorem 1.7.** Suppose that regularity condition (7) holds with some  $0 < r \leq \nu_q$ 12 and the eigenvalues  $\{\lambda_i\}$  of  $L_K$  decay exponentially as 13

$$D_1 \beta^{-i} \le \lambda_i \le D_2 \beta^{-i}, \quad \forall i \in \mathbb{N}$$
 (13)

14 with 
$$\beta > 1$$
 and  $0 < D_1 \leq D_2$ . Let  $0 < \delta < 1$ . If we choose

$$\gamma = C_0 \left(\frac{D_2}{\kappa^2 + 1}\right)^{r+1} \left(\log\frac{6m}{\delta}\right)^{r+1} m^{-\frac{r+1}{\max\{2, 2r+1\}}}$$
(14)

15 and 
$$\lambda = D_2 \frac{\log m}{m}$$
, then with confidence at least  $1 - \delta$ , we have

$$c_{\lambda,\gamma,\mathbf{z}}^{i} = 0, \quad \forall \, i \ge \frac{\log(m+1)}{(2r+1)\log\beta} + 1 \tag{15}$$

16 and

$$\|f_{\mathbf{z}} - f_{\rho}\|_{\rho} \le C' m^{-\min\{r, \frac{1}{2}\}} \left(\log \frac{6m}{\delta}\right)^{r+\frac{5}{2}},$$
 (16)

where the constants  $C_0, C'$  are independent of m or  $\delta$ . 17

6 Z.-C. Guo et al.

**Remark 1.8.** We note that when  $r \ge 1/2$ , the convergence rate in (16), subject to 1 a logarithmic term, is of order  $O(m^{-1/2})$ . This demonstrates the surprising power of 2 the thresholding methods with respect to empirical features. The proof of Theorem 3 1.7 will be given in Sec. 4. 4

The remaining part of this paper is organized as follows. In Sec. 2, some prelim-5 inary analysis of sparsity and error for algorithm (6) is carried out. Sec. 3 develops 6 some technical results which are needed to derive the general results. In Sec. 4, we 7 first prove the general results of the sparsity and error analysis of algorithm (6), and 8 g then we establish the learning rates when the eigenvalues of  $L_K$  decay polynomially or exponentially. 10

#### 2. Error Decomposition 11

In this section, some preliminary analysis of sparsity and error for algorithm (6)12 13 associated with a filter function  $g_{\lambda}$  and a soft thresholding function  $G_{\gamma}$  is carried out. 14

#### 2.1. Representation and decomposition for sparsity 15

From the definition of the soft thresholding function  $G_{\gamma}$ , we have  $c^{i}_{\lambda,\gamma,\mathbf{z}} = 0$  when 16  $|\langle f_{\rho}^{\mathbf{z}}, \phi_i^{\mathbf{x}} \rangle| \leq \frac{\gamma}{2}$ . To get sparsity, we shall choose some  $p = p(m) \in \mathbb{N}$  and  $\gamma = \gamma(m, \delta)$ 17 such that with confidence  $1 - \delta$ , 18

$$c^i_{\lambda,\gamma,\mathbf{z}} = 0, \quad \forall i \ge p+1$$

To this end, we need to estimate the term  $|\langle f_{\rho}^{\mathbf{z}}, \phi_{i}^{\mathbf{x}} \rangle|$ . Recall  $f_{\rho}^{\mathbf{z}} = \frac{1}{m} \sum_{i=1}^{m} y_{i} K_{x_{i}}$ . The conditional expectation of  $f_{\rho}^{\mathbf{z}}$  given  $x_{1}, \ldots, x_{m}$  is  $\frac{1}{m} \sum_{i=1}^{m} f_{\rho}(x_{i}) K_{x_{i}} = L_{K}^{\mathbf{x}} f_{\rho}$ . 19 20 It shows that  $\langle f_{\rho}^{\mathbf{z}}, \phi_{i}^{\mathbf{x}} \rangle$  is close to  $\langle L_{K}^{\mathbf{x}} f_{\rho}, \phi_{i}^{\mathbf{x}} \rangle$ . So we introduce the following decom-21 position 22

$$\langle f_{\rho}^{\mathbf{z}}, \phi_{i}^{\mathbf{x}} \rangle = \langle f_{\rho}^{\mathbf{z}} - L_{K}^{\mathbf{x}} f_{\rho}, \phi_{i}^{\mathbf{x}} \rangle + \langle L_{K}^{\mathbf{x}} f_{\rho}, \phi_{i}^{\mathbf{x}} \rangle.$$

It follows that for  $i \in \mathbb{N}$ , 23

$$|\langle f_{\rho}^{\mathbf{z}}, \phi_{i}^{\mathbf{x}} \rangle| \leq |\langle f_{\rho}^{\mathbf{z}}, \phi_{i}^{\mathbf{x}} \langle - \rangle L_{K}^{\mathbf{x}} f_{\rho}, \phi_{i}^{\mathbf{x}} \rangle| + |\langle L_{K}^{\mathbf{x}} f_{\rho}, \phi_{i}^{\mathbf{x}} \rangle| := J_{1} + J_{2}.$$
(17)

Note that the notations  $J_1$ ,  $J_2$  depend on *i*. They are used for simplicity. 24

#### 2.2. Analysis for sparsity 25

In this subsection, we bound  $J_1$  and  $J_2$  respectively. The first term  $J_1$  can be 26 27 expressed as

$$J_{1} = \left| \langle f_{\rho}^{\mathbf{z}}, \phi_{i}^{\mathbf{x}} \rangle - \langle L_{K}^{\mathbf{x}} f_{\rho}, \phi_{i}^{\mathbf{x}} \rangle \right| = \left| \langle f_{\rho}^{\mathbf{z}}, \phi_{i}^{\mathbf{x}} \rangle - \lambda_{i}^{\mathbf{x}} \langle f_{\rho}, \phi_{i}^{\mathbf{x}} \rangle \right|$$
$$= \left| \lambda_{i}^{\mathbf{x}} \right| \left| \left\langle \frac{1}{\lambda_{i}^{\mathbf{x}}} f_{\rho}^{\mathbf{z}} - f_{\rho}, \phi_{i}^{\mathbf{x}} \right\rangle \right|.$$

It can be easily estimated by the following lemma proved in [10]. Denote  $Z = X \times Y$ .

Lemma 2.1. For any  $\delta \in (0,1)$ , there exists a subset  $U_1$  of  $Z^m$  with measure at least  $1 - \delta/3$  such that

$$\left| \left\langle \frac{1}{\lambda_i^{\mathbf{x}}} f_{\rho}^{\mathbf{z}} - f_{\rho}, \phi_i^{\mathbf{x}} \right\rangle \right| \le \frac{2\sqrt{2}M}{\sqrt{m}} \sqrt{\log \frac{6m}{\delta}}, \quad \forall \, \mathbf{z} \in U_1, \ i \in \mathbb{N}.$$
(18)

Before stating the general result about sparsity, we give the following key lemma [10]. Recall the Hilbert–Schmidt norm of the operator  $L_K - L_K^{\mathbf{x}}$  given by

$$\|L_K - L_K^{\mathbf{x}}\|_{\mathsf{HS}}^2 = \sum_{i=1}^{\infty} \|(L_K - L_K^{\mathbf{x}})\phi_i^{\mathbf{x}}\|_K^2 = \sum_{i,j=1}^{\infty} (\lambda_j - \lambda_i^{\mathbf{x}})^2 (\langle \phi_i^{\mathbf{x}}, \phi_j \rangle)^2.$$
(19)

5 Lemma 2.2. We have

$$\sum_{i=1}^{\infty} (\lambda_i - \lambda_i^{\mathbf{x}})^2 \le \|L_K - L_K^{\mathbf{x}}\|_{\mathsf{HS}}^2.$$
(20)

For any  $\delta \in (0,1)$ , there exists a subset  $U_2$  of  $Z^m$  with measure at least  $1 - \delta/3$ such that

$$\|L_K - L_K^{\mathbf{x}}\|_{\mathsf{HS}} \le \frac{4\kappa^2}{\sqrt{m}} \log \frac{6}{\delta}, \qquad \forall \, \mathbf{z} \in U_2.$$
(21)

8 **Proposition 2.3.** For  $\mathbf{z} \in U_1 \cap U_2$  and  $i \in \mathbb{N}$ , there holds

$$J_1 \le \frac{2\sqrt{2}M}{\sqrt{m}} \left(\sqrt{\lambda_i} + \frac{2\kappa}{\sqrt[4]{m}}\sqrt{\log\frac{6}{\delta}}\right) \sqrt{\log\frac{6m}{\delta}}.$$
(22)

9 **Proof.** By Lemma 2.1, for  $z \in U_1$ , we have

$$J_{1} = \left|\lambda_{i}^{\mathbf{x}}\right| \left|\left\langle \frac{1}{\lambda_{i}^{\mathbf{x}}} f_{\rho}^{\mathbf{z}} - f_{\rho}, \phi_{i}^{\mathbf{x}}\right\rangle\right| = \sqrt{\lambda_{i}^{\mathbf{x}}} \sqrt{\lambda_{i}^{\mathbf{x}}} \left|\left\langle \frac{1}{\lambda_{i}^{\mathbf{x}}} f_{\rho}^{\mathbf{z}} - f_{\rho}, \phi_{i}^{\mathbf{x}}\right\rangle\right|$$
$$\leq \sqrt{\lambda_{i}^{\mathbf{x}}} \frac{2\sqrt{2}M}{\sqrt{m}} \sqrt{\log \frac{6m}{\delta}}.$$

10 To bound  $\sqrt{\lambda_i^{\mathbf{x}}}$ , we have  $|\lambda_i^{\mathbf{x}} - \lambda_i| \leq ||L_K - L_K^{\mathbf{x}}||_{\mathsf{HS}}$  from (20). It follows that 11  $\sqrt{\lambda_i^{\mathbf{x}}} \leq \sqrt{\lambda_i} + \sqrt{||L_K - L_K^{\mathbf{x}}||_{\mathsf{HS}}}$ , and by Lemma 2.2, for  $\mathbf{z} \in U_2$ , we have

$$\sqrt{\lambda_i^{\mathbf{x}}} \le \sqrt{\lambda_i} + \frac{2\kappa}{\sqrt[4]{m}} \sqrt{\log \frac{6}{\delta}},$$

12 Then our desired bound follows by combining the above two estimates.

13

Estimating the second term  $J_2$  of (17) is more involved.

 $8 \quad Z.\text{-}C. \ Guo \ et \ al.$ 

**Proposition 2.4.** For  $\mathbf{z} \in U_2$  and  $i \in \mathbb{N}$ , there holds

$$J_2 \leq \left\{ \frac{8\kappa^{2r+2}}{\sqrt{m}} \left( \lambda_i^{\min\{r,1\}} + \left(\frac{4\kappa^2}{\sqrt{m}}\right)^{\min\{r,1\}} \right) + 2^{2r} \left( \lambda_i^{1+r} + \left(\frac{4\kappa^2}{\sqrt{m}}\right)^{1+r} \right) \right\} \|u_\rho\|_K \left(\log\frac{6}{\delta}\right)^{1+r}$$

**Proof.** Recall  $f_{\rho} = L_K^r u_{\rho} = \sum_{j \in \mathbb{N}} \lambda_j^r d_j \phi_j$  with  $u_{\rho} = \sum_{j \in \mathbb{N}} d_j \phi_j$  and  $||u_{\rho}||_K =$  $||\{d_j\}||_{\ell^2}$ . Now we estimate the term  $J_2 = |\langle L_K^{\mathbf{x}} f_{\rho}, \phi_i^{\mathbf{x}} \rangle| = |\lambda_i^{\mathbf{x}} \langle f_{\rho}, \phi_i^{\mathbf{x}} \rangle|$ . To this end,

4 we divide  $\lambda_i^{\mathbf{x}} \langle f_{\rho}, \phi_i^{\mathbf{x}} \rangle$  into two parts

$$\lambda_i^{\mathbf{x}} \langle f_{\rho}, \phi_i^{\mathbf{x}} \rangle = \left( \sum_{j: \lambda_j \ge 2\lambda_i^{\mathbf{x}}} + \sum_{j: \lambda_j < 2\lambda_i^{\mathbf{x}}} \right) \lambda_i^{\mathbf{x}} \lambda_j^r d_j \langle \phi_j, \phi_i^{\mathbf{x}} \rangle.$$
(23)

5 By Lemma 2.2 and (20), since  $\lambda_1 \leq ||L_K|| \leq \kappa^2$ , the first sum in (23) can be 6 estimated as

$$\begin{aligned} \left| \sum_{j:\lambda_j \ge 2\lambda_i^{\mathbf{x}}} \lambda_i^{\mathbf{x}} \lambda_j^r d_j \langle \phi_j, \phi_i^{\mathbf{x}} \rangle \right| \\ & \le (2\lambda_i^{\mathbf{x}})^{\min\{r,1\}} \kappa^{2\max\{0,r-1\}} \sum_j |d_j| |\lambda_j - \lambda_i^{\mathbf{x}}| |\langle \phi_j, \phi_i^{\mathbf{x}} \rangle| \\ & \le (2\lambda_i^{\mathbf{x}})^{\min\{r,1\}} \kappa^{2r} \|u_\rho\|_K \frac{4\kappa^2}{\sqrt{m}} \log \frac{6}{\delta} \\ & \le \frac{8\kappa^{2r+2} \|u_\rho\|_K}{\sqrt{m}} \left( \lambda_i^{\min\{r,1\}} + \left(\frac{4\kappa^2}{\sqrt{m}} \log \frac{6}{\delta}\right)^{\min\{r,1\}} \right) \log \frac{6}{\delta}. \end{aligned}$$

7 Note that for  $t \ge 1$  and a, b > 0, one has  $(a+b)^t \le 2^{t-1}(a^t+b^t)$ . Hence the second 8 sum in (23) is bounded by

$$\left| \sum_{j:\lambda_j < 2\lambda_i^{\mathbf{x}}} \lambda_i^{\mathbf{x}} \lambda_j^{\mathbf{r}} d_j \langle \phi_j, \phi_i^{\mathbf{x}} \rangle \right| \le 2^r (\lambda_i^{\mathbf{x}})^{1+r} \sum_j |d_j \langle \phi_j, \phi_i^{\mathbf{x}} \rangle|$$
$$\le 2^{2r} \left( \lambda_i^{1+r} + \left( \frac{4\kappa^2}{\sqrt{m}} \log \frac{6}{\delta} \right)^{1+r} \right) \|u_\rho\|_K.$$

9 This completes the proof.

1

Putting the bounds in Propositions 2.3 and 2.4 into (17), we obtain the following upper bound for  $|\langle f_{\rho}^{\mathbf{z}}, \phi_{i}^{\mathbf{x}} \rangle|$  with  $i \in \mathbb{N}$ .

**Proposition 2.5.** Under regularity condition (7) with some r > 0, for  $\mathbf{z} \in U_1 \cap U_2$ and  $i \in \mathbb{N}$ , we have

$$\begin{split} |\langle f_{\rho}^{\mathbf{z}}, \phi_{i}^{\mathbf{x}} \rangle| &\leq \frac{C_{0}}{2} \left( \log \frac{6m}{\delta} \right)^{1+r} \\ & \times \begin{cases} \max\left\{ \frac{\lambda_{i}}{\kappa^{2}}, \frac{1}{\sqrt{m}} \right\}^{1+r}, & \text{for } 0 < r \leq \frac{1}{2}, \\ \max\left\{ \left( \frac{\lambda_{i}}{\kappa^{2}} \right)^{r+\frac{1}{2}}, \frac{1}{\sqrt{m}} \right\} \max\left\{ \frac{\lambda_{i}}{\kappa^{2}}, \frac{1}{\sqrt{m}} \right\}^{\frac{1}{2}}, & \text{for } r > \frac{1}{2}, \end{cases} \end{split}$$

3 where  $C_0$  is the constant independent of  $\delta$ , m, or  $\lambda_i$  given by

$$C_0 = 64 \max\left\{\sqrt{2\kappa}M, 8\kappa^{2r+4} \|u_\rho\|_K, 4^{2r}\kappa^{2r+2} \|u_\rho\|_K\right\}.$$
 (24)

4 **Proof.** Putting the bounds for  $J_1$  and  $J_2$  in Propositions 2.3 and 2.4 back into 5 (17), we know that for  $\mathbf{z} \in U_1 \cap U_2$  and  $i \in \mathbb{N}$ ,

$$\begin{split} \left| \langle f_{\rho}^{\mathbf{z}}, \phi_{i}^{\mathbf{x}} \rangle \right| &\leq 4\sqrt{2}\kappa M \left( \frac{\sqrt{\lambda_{i}}}{\kappa\sqrt{m}} + \left(\frac{1}{\sqrt{m}}\right)^{\frac{3}{2}} \right) \log \frac{6m}{\delta} \\ &+ 32\kappa^{2r+4} \|u_{\rho}\|_{K} \left( \frac{(\lambda_{i}/\kappa^{2})^{\min\{r,1\}}}{\sqrt{m}} + \left(\frac{1}{\sqrt{m}}\right)^{\min\{r,1\}+1} \right) \left(\log \frac{6}{\delta} \right)^{r+1} \\ &+ 4^{2r+1}\kappa^{2r+2} \|u_{\rho}\|_{K} \left( \left(\frac{\lambda_{i}}{\kappa^{2}}\right)^{1+r} + \left(\frac{1}{\sqrt{m}}\right)^{1+r} \right) \left(\log \frac{6m}{\delta} \right)^{1+r} \\ &\leq \tilde{C}_{0} \left( \frac{\sqrt{\lambda_{i}}}{\kappa\sqrt{m}} + 3\left(\frac{1}{\sqrt{m}}\right)^{\min\{\frac{3}{2},r+1\}} \\ &+ \frac{\left(\frac{\lambda_{i}}{\kappa^{2}}\right)^{\min\{r,1\}}}{\sqrt{m}} + \left(\frac{\lambda_{i}}{\kappa^{2}}\right)^{1+r} \right) \left(\log \frac{6}{\delta} \right)^{1+r}, \end{split}$$

6 where  $\tilde{C}_0 = \max\{4\sqrt{2\kappa}M, 32\kappa^{2r+4} \|u_\rho\|_K, 4^{2r+1}\kappa^{2r+2} \|u_\rho\|_K\}.$ 7 When  $0 < r \le 1/2$ , one has  $\min\{r, 1\} = r$ . So

$$\left(\frac{\lambda_i}{\kappa^2}\right)^{\min\{r,1\}} = \left(\frac{\lambda_i}{\kappa^2}\right)^r \ge \frac{\sqrt{\lambda_i}}{\kappa} \quad \text{and} \quad \left(\frac{1}{\sqrt{m}}\right)^{\min\{\frac{3}{2},r+1\}} = \left(\frac{1}{\sqrt{m}}\right)^{1+r}.$$

# 10 Z.-C. Guo et al.

1

One applies Young's inequality to obtain

$$\left(\frac{\lambda_i}{\kappa^2}\right)^r \frac{1}{\sqrt{m}} \le \frac{\left(\frac{\lambda_i}{\kappa^2}\right)^{1+r}}{1+\frac{1}{r}} + \frac{\left(\frac{1}{\sqrt{m}}\right)^{1+r}}{1+r}.$$
(25)

Therefore, for  $\mathbf{z} \in U_1 \cap U_2$  and  $i \in \mathbb{N}$ , we have 2

$$\begin{split} \left| \langle f_{\rho}^{\mathbf{z}}, \phi_{i}^{\mathbf{x}} \rangle \right| &\leq \tilde{C}_{0} \left( 5 \left( \frac{1}{\sqrt{m}} \right)^{1+r} + 3 \left( \frac{\lambda_{i}}{\kappa^{2}} \right)^{1+r} \right) \left( \log \frac{6m}{\delta} \right)^{1+r} \\ &\leq 8 \tilde{C}_{0} \max \left\{ \frac{1}{\sqrt{m}}, \frac{\lambda_{i}}{\kappa^{2}} \right\}^{1+r} \left( \log \frac{6m}{\delta} \right)^{1+r}. \end{split}$$

3 When r > 1/2, one has

$$\left(\frac{1}{\sqrt{m}}\right)^{\min\left\{\frac{3}{2},r+1\right\}} = \left(\frac{1}{\sqrt{m}}\right)^{\frac{3}{2}} \quad \text{and} \quad \left(\frac{\lambda_i}{\kappa^2}\right)^{\min\left\{r,1\right\}} \le \frac{\sqrt{\lambda_i}}{\kappa},$$

which implies that for  $\mathbf{z} \in U_1 \cap U_2$  and  $i \in \mathbb{N}$ , 4

$$\begin{split} \left| \langle f_{\rho}^{\mathbf{z}}, \phi_{i}^{\mathbf{x}} \rangle \right| &\leq \tilde{C}_{0} \left( 3 \left( \frac{1}{\sqrt{m}} \right)^{3/2} + 2 \frac{\sqrt{\lambda_{i}}}{\kappa \sqrt{m}} + \left( \frac{\lambda_{i}}{\kappa^{2}} \right)^{1+r} \right) \left( \log \frac{6m}{\delta} \right)^{1+r} \\ &\leq 6 \tilde{C}_{0} \max \left\{ \left( \frac{\lambda_{i}}{\kappa^{2}} \right)^{r+\frac{1}{2}}, \frac{1}{\sqrt{m}} \right\} \left( \max \left\{ \frac{\lambda_{i}}{\kappa^{2}}, \frac{1}{\sqrt{m}} \right\} \right)^{\frac{1}{2}} \left( \log \frac{6m}{\delta} \right)^{1+r}. \end{split}$$
he proof is thus completed by letting  $C_{0} = 16 \tilde{C}_{0}.$ 

5 The proof is thus completed by letting  $C_0 = 16\hat{C}_0$ .

**Proposition 2.6.** Assume regularity condition (7) with some  $0 < r \leq \nu_g$ . If  $\gamma$ 6 satisfies7

$$\gamma \geq \begin{cases} C_0 \left( \log \frac{6m}{\delta} \right)^{1+r} \max\left\{ \frac{\lambda_p}{\kappa^2}, \frac{1}{\sqrt{m}} \right\}^{1+r}, & \text{for } 0 < r \leq \frac{1}{2}, \\ C_0 \left( \log \frac{6m}{\delta} \right)^{1+r} \max\left\{ \left( \frac{\lambda_p}{\kappa^2} \right)^{r+\frac{1}{2}}, \frac{1}{\sqrt{m}} \right\} & (26) \\ \max\left\{ \frac{\lambda_p}{\kappa^2}, \frac{1}{\sqrt{m}} \right\}^{\frac{1}{2}}, & \text{for } r > \frac{1}{2}, \end{cases}$$

where  $C_0$  is the constant given by (24), then we have 8

$$c^i_{\gamma,\lambda,\mathbf{z}} = 0, \quad \forall \, \mathbf{z} \in U_1 \cap U_2, i \ge p+1.$$

**Proof.** If  $\gamma$  satisfies condition (26), by Proposition 2.5, for  $\mathbf{z} \in U_1 \cap U_2$  and  $i \ge p+1$ , 9 we have 10

$$|\langle f_{\rho}^{\mathbf{z}}, \phi_{i}^{\mathbf{x}} \rangle| \leq \frac{\gamma}{2}$$

which implies  $c_{\gamma,\lambda,\mathbf{z}}^i = 0$  by the definition of  $G_{\gamma}$ . 11

### 1 2.3. Representation and decomposition for error

Now we consider how the output function  $f_{\mathbf{z}}$  of algorithm (6) approximates  $f_{\rho}$ . Convergence rates of the approximation in  $L^2_{\rho_X}$  will be established. We first make an error decomposition [5, 22, 14] and divide the error  $f_{\mathbf{z}} - f_{\rho}$  into two parts as

$$f_{\mathbf{z}} - f_{\rho} = \left(f_{\mathbf{z}} - \tilde{f}_{\mathbf{x}}\right) + \left(\tilde{f}_{\mathbf{x}} - f_{\rho}\right),$$

5 where

$$\tilde{f}_{\mathbf{x}} = g_{\lambda}(L_K^{\mathbf{x}}) L_K^{\mathbf{x}} f_{\rho}.$$

For the first part, we see from the identity  $||f||_{\rho} = ||L_K^{1/2}f||_K$  for  $f \in \mathcal{H}_K$  and the fact  $||L_K^{1/2}(\lambda I + L_K)^{-1/2}|| \le 1$  that

$$\|f_{\mathbf{z}} - \tilde{f}_{\mathbf{x}}\|_{\rho} = \|L_{K}^{1/2}(f_{\mathbf{z}} - \tilde{f}_{\mathbf{x}})\|_{K} \le \|(\lambda I + L_{K})^{1/2}(f_{\mathbf{z}} - \tilde{f}_{\mathbf{x}})\|_{K}.$$

8 Then we use the expression  $\tilde{f}_{\mathbf{x}} = g_{\lambda}(L_K^{\mathbf{x}})L_K^{\mathbf{x}}f_{\rho} = g_{\lambda}(L_K^{\mathbf{x}})\sum_{i\in\mathbb{N}}\langle L_K^{\mathbf{x}}f_{\rho}, \phi_i^{\mathbf{x}}\rangle\phi_i^{\mathbf{x}}$  to 9 divide the term  $(\lambda I + L_K)^{1/2}(f_{\mathbf{z}} - \tilde{f}_{\mathbf{x}})$  further as

$$\begin{aligned} (\lambda I + L_K)^{1/2} (f_{\mathbf{z}} - \tilde{f}_{\mathbf{x}}) &= (\lambda I + L_K)^{1/2} g_{\lambda} (L_K^{\mathbf{x}}) \sum_i \left( G_{\gamma} (\langle f_{\rho}^{\mathbf{z}}, \phi_i^{\mathbf{x}} \rangle) - \langle L_K^{\mathbf{x}} f_{\rho}, \phi_i^{\mathbf{x}} \rangle \right) \phi_i^{\mathbf{x}} \\ &= (\lambda I + L_K)^{1/2} (\lambda I + L_K^{\mathbf{x}})^{-1/2} (\lambda I + L_K^{\mathbf{x}})^{1/2} g_{\lambda} (L_K^{\mathbf{x}}) \\ &\times (\lambda I + L_K^{\mathbf{x}})^{1/2} (\lambda I + L_K^{\mathbf{x}})^{-1/2} \sum_i \left( G_{\gamma} (\langle f_{\rho}^{\mathbf{z}}, \phi_i^{\mathbf{x}} \rangle) \right) \\ &- \langle L_K^{\mathbf{x}} f_{\rho}, \phi_i^{\mathbf{x}} \rangle ) \phi_i^{\mathbf{x}} \\ &= (\lambda I + L_K)^{1/2} (\lambda I + L_K^{\mathbf{x}})^{-1/2} g_{\lambda} (L_K^{\mathbf{x}}) (\lambda I + L_K^{\mathbf{x}}) \\ &\times (\lambda I + L_K^{\mathbf{x}})^{-1/2} \sum_i \left( G_{\gamma} (\langle f_{\rho}^{\mathbf{z}}, \phi_i^{\mathbf{x}} \rangle) - \langle L_K^{\mathbf{x}} f_{\rho}, \phi_i^{\mathbf{x}} \rangle \right) \phi_i^{\mathbf{x}}. \end{aligned}$$

10 The property (1) of the filter function  $g_{\lambda}$  tells us that  $||g_{\lambda}(L_K^{\mathbf{x}})(\lambda I + L_K^{\mathbf{x}})|| \leq 2b$ ,

11 which implies the following error decomposition.

## 12 **Proposition 2.7.** We have

$$\|f_{\mathbf{z}} - f_{\rho}\|_{\rho} \le I_1 + I_2,$$
(27)

13 where

$$I_{1} = 2b \| (\lambda I + L_{K})^{1/2} (\lambda I + L_{K}^{\mathbf{x}})^{-1/2} \| \\ \left\| (\lambda I + L_{K}^{\mathbf{x}})^{-1/2} \sum_{i} \left( G_{\gamma} (\langle f_{\rho}^{\mathbf{z}}, \phi_{i}^{\mathbf{x}} \rangle) - \langle L_{K}^{\mathbf{x}} f_{\rho}, \phi_{i}^{\mathbf{x}} \rangle \right) \phi_{i}^{\mathbf{x}} \right\|_{K}$$

14 and

$$I_2 = \|f_{\mathbf{x}} - f_{\rho}\|_{\rho}$$

# **2**nd Reading

 $12 \quad Z.\text{-}C. \ Guo \ et \ al.$ 

1 The term  $\|(L_K + \lambda I)^{1/2} (L_K^{\mathbf{x}} + \lambda I)^{-1/2}\|$  and  $I_2$  are well estimated in [11] as 2 follows. Denote

$$\mathcal{B}_{m,\lambda} = \frac{2\kappa}{\sqrt{m}} \left\{ \frac{\kappa}{\sqrt{m\lambda}} + \sqrt{\sum_{i \in \mathbb{N}} \frac{\lambda_i}{\lambda_i + \lambda}} \right\}.$$

**Lemma 2.8.** For any  $\delta \in (0, 1)$ , there exists a subset  $U_3$  of  $Z^m$  with measure at least  $1 - \delta/3$  such that

$$\left\| (L_K + \lambda I)^{1/2} (L_K^{\mathbf{x}} + \lambda I)^{-1/2} \right\| \le \sqrt{2} \left( \frac{\mathcal{B}_{m,\lambda}}{\sqrt{\lambda}} + 1 \right) \log \frac{6}{\delta}, \quad \forall \mathbf{z} \in U_3.$$
(28)

5 **Proposition 2.9.** For  $\mathbf{z} \in U_2 \cap U_3$ , there holds

$$I_{2} = \|\hat{f}_{\mathbf{x}} - f_{\rho}\|_{\rho}$$

$$\leq \begin{cases} C_{r}' \left(\frac{\mathcal{B}_{m,\lambda}}{\sqrt{\lambda}} + 1\right)^{2r+1} \lambda^{r+\frac{1}{2}} \left(\log\frac{6}{\delta}\right)^{2r+1}, & \text{for } 0 < r \leq 1, \\ C_{r} \left(\frac{\mathcal{B}_{m,\lambda}}{\sqrt{\lambda}} + 1\right) \left(4\kappa^{2}\sqrt{\frac{\lambda}{m}} + \lambda^{r+\frac{1}{2}}\right) \left(\log\frac{6}{\delta}\right)^{2}, & \text{for } r > 1, \end{cases}$$

$$(29)$$

- 6 where  $C_r, C'_r$  are constants independent of  $\delta$ , m, or  $\lambda$ .
- 7 **Proof.** It was shown in [11] that  $\|\tilde{f}_{\mathbf{x}} f_{\rho}\|_{\rho}$  can be bounded by

$$\begin{cases} 2^{r+\frac{1}{2}}(b+1+c_{r+\frac{1}{2}}) \|u_{\rho}\|_{K} \\ \|(L_{K}+\lambda I)^{1/2}(L_{K}^{\mathbf{x}}+\lambda I)^{-1/2}\|^{2r+1}\lambda^{r+\frac{1}{2}}, & \text{for } 0 < r \leq 1, \\ C_{r} \|(L_{K}+\lambda I)^{1/2}(L_{K}^{\mathbf{x}}+\lambda I)^{-1/2}\|\left(\lambda^{\frac{1}{2}}\|L_{K}-L_{K}^{\mathbf{x}}\|+\lambda^{r+\frac{1}{2}}\right), & \text{for } r > 1, \end{cases}$$

8 where  $C_r, c_{r+\frac{1}{2}}$  are constants independent of  $\delta$ , m, or  $\lambda$ . Then by Lemmas 2.2 9 and 2.8 we know that for  $\mathbf{z} \in U_2 \cap U_3$ , there holds

$$\|\tilde{f}_{\mathbf{x}} - f_{\rho}\|_{\rho} \leq \begin{cases} 2^{2r+1}(b+1+c_{r+\frac{1}{2}})\|u_{\rho}\|_{K} \left(\frac{\mathcal{B}_{m,\lambda}}{\sqrt{\lambda}}+1\right)^{2r+1} \\ \lambda^{r+\frac{1}{2}} \left(\log\frac{6}{\delta}\right)^{2r+1}, & \text{for } 0 < r \leq 1, \\ C_{r}\sqrt{2} \left(\frac{\mathcal{B}_{m,\lambda}}{\sqrt{\lambda}}+1\right) \left(4\kappa^{2}\sqrt{\frac{\lambda}{m}}+\lambda^{r+\frac{1}{2}}\right) \left(\log\frac{6}{\delta}\right)^{2}, & \text{for } r > 1, \end{cases}$$

which verifies our desired result by setting  $C'_r = 2^{r+\frac{1}{2}} (b+1+c_{r+\frac{1}{2}}) \|u_\rho\|_K$ .  $\Box$ 

11 It remains to bound  $I_1$  in (27). The core analysis of the error is for the term 12  $\left\| (\lambda I + L_K^{\mathbf{x}})^{-1/2} \sum_i \left( G_{\gamma}(\langle f_{\rho}^{\mathbf{z}}, \phi_i^{\mathbf{x}} \rangle) - \langle L_K^{\mathbf{x}} f_{\rho}, \phi_i^{\mathbf{x}} \rangle \right) \phi_i^{\mathbf{x}} \right\|_K$ , which will be given in the 13 next section.

### 1 3. Analysis of the Thresholding Error

In this section, we estimate the term  $\|(\lambda I + L_K^{\mathbf{x}})^{-1/2} \sum_i (G_{\gamma}(\langle f_{\rho}^{\mathbf{z}}, \phi_i^{\mathbf{x}} \rangle) - \langle L_K^{\mathbf{x}} f_{\rho} \rangle) \phi_i^{\mathbf{x}} \|_K$ . To this end, we first prove that with  $\gamma$  chosen as in (26) and  $p \in \mathbb{N}$ , we have

$$c^{i}_{\gamma,\lambda,\mathbf{z}} = 0, \quad \forall \, \mathbf{z} \in U_1 \cap U_2, i \in \mathbb{N} \setminus \mathcal{S}, \tag{30}$$

5 where

$$S = S_{p,\mathbf{x}} = \left\{ i = 1, \dots, p : \lambda_i^{\mathbf{x}} > \frac{\lambda_p}{2} \right\}$$

6 To verify this statement, we first notice from Proposition 2.6 that

 $c^i_{\gamma,\lambda,\mathbf{z}} = 0, \quad \forall \, \mathbf{z} \in U_1 \cap U_2, i \ge p+1.$ 

7 Then for  $i \in \{1, \ldots, p\}$  and  $i \notin S$  (that is,  $\lambda_i^{\mathbf{x}} \leq \lambda_p/2$ ), we have from (18) and (21)

$$\begin{split} \left| \langle f_{\rho}^{\mathbf{z}}, \phi_{i}^{\mathbf{x}} \rangle \right| &\leq \left| \langle f_{\rho}^{\mathbf{z}}, \phi_{i}^{\mathbf{x}} \rangle - \langle L_{K}^{\mathbf{x}} f_{\rho}, \phi_{i}^{\mathbf{x}} \rangle \right| + \left| \lambda_{i}^{\mathbf{x}} \langle f_{\rho}, \phi_{i}^{\mathbf{x}} \rangle \right| \\ &\leq \frac{2\sqrt{2}M\sqrt{\lambda_{i}^{\mathbf{x}}}}{\sqrt{m}} \sqrt{\log \frac{6m}{\delta}} + \left| \left( \sum_{j:\lambda_{j} \geq 2\lambda_{i}^{\mathbf{x}}} + \sum_{j:\lambda_{j} < 2\lambda_{i}^{\mathbf{x}}} \right) \lambda_{i}^{\mathbf{x}} \lambda_{j}^{r} d_{j} \langle \phi_{j}, \phi_{i}^{\mathbf{x}} \rangle \right| \\ &\leq \frac{2M\sqrt{\lambda_{p}}}{\sqrt{m}} \sqrt{\log \frac{6m}{\delta}} + \lambda_{p}^{\min\{r,1\}} \kappa^{2r} \| u_{\rho} \|_{K} \frac{4\kappa^{2}}{\sqrt{m}} \log \frac{6}{\delta} + \frac{1}{2} \lambda_{p}^{1+r} \| u_{\rho} \|_{K} \\ &\leq \frac{C_{1}^{*}}{2} \left\{ \log \frac{6m}{\delta} \max \left\{ \frac{\lambda_{p}}{\kappa^{2}}, \frac{1}{\sqrt{m}} \right\}^{1+r}, \qquad \text{if } 0 < r \leq \frac{1}{2}, \\ \log \frac{6m}{\delta} \max \left\{ \left( \frac{\lambda_{p}}{\kappa^{2}} \right)^{r+\frac{1}{2}}, \frac{1}{\sqrt{m}} \right\} \left( \frac{\lambda_{p}}{\kappa^{2}} \right)^{\frac{1}{2}}, \quad \text{if } r > \frac{1}{2}, \end{split}$$

where  $C_1^* = \max\{16\kappa M, 32\kappa^{3+2r} \| u_\rho \|_K\}$ . Obviously,  $C_0 \ge C_1^*$ . Hence we have  $|\langle f_\rho^{\mathbf{z}}, \phi_i^{\mathbf{x}} \rangle| \le \frac{\gamma}{2}$  and thereby

$$c^{i}_{\gamma,\lambda,\mathbf{z}} = 0, \qquad \forall \, \mathbf{z} \in U_1 \cap U_2, i \in \{1,\ldots,p\}, i \notin \mathcal{S}.$$

10 Combining the above two cases, we know that  $c_{\gamma,\lambda,\mathbf{z}}^i = 0$ , for  $\mathbf{z} \in U_1 \cap U_2$ , and 11  $i \in \mathbb{N} \setminus S$ . which means (30) holds true.

12 Since  $\{\phi_i^{\mathbf{x}}\}_i$  form an orthogonal basis of  $\mathcal{H}_K$ , when (30) holds true, we have for 13  $\mathbf{z} \in U_1 \cap U_2$ ,

$$\left\| (\lambda I + L_K^{\mathbf{x}})^{-1/2} \sum_i (G_{\gamma}(\langle f_{\rho}^{\mathbf{z}}, \phi_i^{\mathbf{x}} \rangle) - \langle L_K^{\mathbf{x}} f_{\rho}, \phi_i^{\mathbf{x}} \rangle) \phi_i^{\mathbf{x}} \right\|_K$$
$$= \left\| \sum_i (\lambda + \lambda_i^{\mathbf{x}})^{-1/2} \left( G_{\gamma}(\langle f_{\rho}^{\mathbf{z}}, \phi_i^{\mathbf{x}} \rangle) - \langle L_K^{\mathbf{x}} f_{\rho}, \phi_i^{\mathbf{x}} \rangle \right) \phi_i^{\mathbf{x}} \right\|_K$$

14 Z.-C. Guo et al.

$$= \left(\sum_{i} (\lambda + \lambda_{i}^{\mathbf{x}})^{-1} \left(G_{\gamma}(\langle f_{\rho}^{\mathbf{z}}, \phi_{i}^{\mathbf{x}} \rangle) - \langle L_{K}^{\mathbf{x}} f_{\rho}, \phi_{i}^{\mathbf{x}} \rangle\right)^{2}\right)^{1/2}$$

$$\leq \left(\sum_{i \in \mathbb{N} \setminus \mathcal{S}} \frac{(\lambda_{i}^{\mathbf{x}})^{2}}{\lambda + \lambda_{i}^{\mathbf{x}}} (\langle f_{\rho}, \phi_{i}^{\mathbf{x}} \rangle)^{2}\right)^{1/2}$$

$$+ \left(\sum_{i \in \mathcal{S}} (\lambda + \lambda_{i}^{\mathbf{x}})^{-1} \left(G_{\gamma}(\langle f_{\rho}^{\mathbf{z}}, \phi_{i}^{\mathbf{x}} \rangle) - \langle L_{K}^{\mathbf{x}} f_{\rho}, \phi_{i}^{\mathbf{x}} \rangle\right)^{2}\right)^{1/2}$$

$$:= I_{11} + I_{12},$$

- 1 where the last inequality holds due to (30).
- 2 We estimate  $I_{11}$  and  $I_{12}$  separately in the following. Denote

$$\Lambda_{m,p} = \max\left\{\frac{\lambda_p}{\kappa^2}, \frac{1}{\sqrt{m}}\right\}.$$
(31)

Proposition 3.1. Let  $p \in \mathbb{N}$ . Under regularity condition (7) with some r > 0, we have for  $\mathbf{z} \in U_1 \cap U_2 \cap U_3$ ,

$$\begin{cases} I_{11} \leq 8 \|u_{\rho}\|_{K} \kappa^{2r+2} \left\{ \min\left\{\frac{\Lambda_{m,p}}{\sqrt{\lambda}}, \Lambda_{m,p}^{1/2}\right\} \lambda_{p}^{r} + \frac{\lambda_{p}^{\min\{1,r\}} \lambda^{\min\{r-\frac{1}{2},0\}}}{(2\lambda + \lambda_{p})^{\min\{r,\frac{1}{2}\}} \sqrt{m}} \right. \\ \left. + 2^{r} \lambda_{p}^{\min\{r-1,0\}} \Lambda_{m,p}^{1/2} \left( \left(\sum_{i=p+1}^{\infty} \lambda_{i}^{\max\{2,2r\}}\right)^{1/2} + \frac{8}{\sqrt{m}} \right) \right\} \left(\log\frac{6}{\delta}\right)^{\frac{3}{2}} . \end{cases}$$

**Proof.** Recall  $f_{\rho} = L_K^r u_{\rho} = \sum_{j \in \mathbb{N}} \lambda_j^r d_j \phi_j$  with  $u_{\rho} = \sum_{j \in \mathbb{N}} d_j \phi_j$  and  $||u_{\rho}||_K =$ 6  $||\{d_j\}||_{\ell^2}$ . We first decompose  $I_{11}$  as

$$\left(\sum_{i\in\mathbb{N}\setminus\mathcal{S}}\frac{(\lambda_{i}^{\mathbf{x}})^{2}}{\lambda+\lambda_{i}^{\mathbf{x}}}\langle f_{\rho},\phi_{i}^{\mathbf{x}}\rangle^{2}\right)^{1/2} \leq \left(\sum_{i\in\mathbb{N}\setminus\mathcal{S}}\frac{(\lambda_{i}^{\mathbf{x}})^{2}}{\lambda+\lambda_{i}^{\mathbf{x}}}\left\langle\sum_{j=p+1}^{\infty}\lambda_{j}^{r}d_{j}\phi_{j},\phi_{i}^{\mathbf{x}}\right\rangle^{2}\right)^{1/2} + \left(\left(\sum_{i\in\{1,\dots,p\}\setminus\mathcal{S}}+\sum_{i=p+1}^{\infty}\right)\frac{(\lambda_{i}^{\mathbf{x}})^{2}\|u_{\rho}\|_{K}^{2}}{\lambda+\lambda_{i}^{\mathbf{x}}}\sum_{j=1}^{p}\lambda_{j}^{2r}\langle\phi_{j},\phi_{i}^{\mathbf{x}}\rangle^{2}\right)^{1/2}. \quad (32)$$

1 For  $i \in \mathbb{N}\backslash S$ , one has  $\lambda_i^{\mathbf{x}} \leq \lambda_p/2$  when  $i \leq p$ , and  $\lambda_i^{\mathbf{x}} \leq \lambda_i + \|L_K - L_K^{\mathbf{x}}\|_{\mathsf{HS}} \leq \lambda_p + \frac{4\kappa^2}{\sqrt{m}} \log \frac{6}{\delta}$  when i > p. So the first part in (32) can be bounded as

$$\left(\sum_{i\in\mathbb{N}\backslash\mathcal{S}}\frac{(\lambda_{i}^{\mathbf{x}})^{2}}{\lambda+\lambda_{i}^{\mathbf{x}}}\left\langle\sum_{j=p+1}^{\infty}\lambda_{j}^{r}d_{j}\phi_{j},\phi_{i}^{\mathbf{x}}\right\rangle^{2}\right)^{1/2}$$

$$\leq\min\left\{\lambda^{-1/2}\left(\lambda_{p}+\frac{4\kappa^{2}}{\sqrt{m}}\log\frac{6}{\delta}\right),\left(\lambda_{p}+\frac{4\kappa^{2}}{\sqrt{m}}\log\frac{6}{\delta}\right)^{1/2}\right\}\lambda_{p}^{r}\|u_{\rho}\|_{K}$$

$$\leq 8\kappa^{2}\min\left\{\frac{\Lambda_{m,p}}{\sqrt{\lambda}},\Lambda_{m,p}^{1/2}\right\}\lambda_{p}^{r}\log\frac{6}{\delta}\|u_{\rho}\|_{K}.$$

3 Then we turn to the second part of (32).

4 When  $r \leq 1/2$ , for j = 1, ..., p, and  $i \in \{1, ..., p\} \setminus S$ , the fact  $2\lambda_i^{\mathbf{x}} \leq \lambda_p \leq \lambda_j$ 5 implies  $\lambda_j \leq 2(\lambda_j - \lambda_i^{\mathbf{x}})$ , and that  $(\lambda_i^{\mathbf{x}})^{2-2r} \lambda_j^{2r} \leq (\lambda_p/2)^{2-2r} \lambda_j^{2r} \leq 2^{2r-2} \lambda_j^2 \leq$ 6  $2^{2r} (\lambda_j - \lambda_i^{\mathbf{x}})^2$ . We also have

$$\frac{(\lambda_i^{\mathbf{x}})^{2r}}{\lambda + \lambda_i^{\mathbf{x}}} = \left(\frac{\lambda_i^{\mathbf{x}}}{\lambda + \lambda_i^{\mathbf{x}}}\right)^{2r} \left(\frac{1}{\lambda + \lambda_i^{\mathbf{x}}}\right)^{1-2r} \le \left(\frac{\lambda_p}{2\lambda + \lambda_p}\right)^{2r} \lambda^{2r-1}.$$

7 It follows that

$$\left(\sum_{i\in\{1,\ldots,p\}\setminus\mathcal{S}} \frac{(\lambda_i^{\mathbf{x}})^2 \|u_\rho\|_K^2}{\lambda + \lambda_i^{\mathbf{x}}} \sum_{j=1}^p \lambda_j^{2r} \langle \phi_j, \phi_i^{\mathbf{x}} \rangle^2 \right)^{1/2} \\
\leq 2^r \|u_\rho\|_K \left(\frac{\lambda_p}{2\lambda + \lambda_p}\right)^r \lambda^{r-\frac{1}{2}} \left(\sum_{i,j} (\lambda_j - \lambda_i^{\mathbf{x}})^2 \langle \phi_j, \phi_i^{\mathbf{x}} \rangle^2 \right)^{1/2} \\
\leq 2^r \|u_\rho\|_K \left(\frac{\lambda_p}{2\lambda + \lambda_p}\right)^r \lambda^{r-\frac{1}{2}} \frac{4\kappa^2}{\sqrt{m}} \log \frac{6}{\delta}.$$

8 When  $1/2 < r \le 1$ , one has

$$\frac{(\lambda_i^{\mathbf{x}})^2 \lambda_j^{2r}}{\lambda + \lambda_i^{\mathbf{x}}} \le \frac{4^{-1} \lambda_p^2 \lambda_j^{2r}}{\lambda + \frac{\lambda_p}{2}} \le \frac{4^{-1} \lambda_p^{2r} \lambda_j^2}{\lambda + \frac{\lambda_p}{2}} \le \frac{\lambda_p^{2r} (\lambda_j - \lambda_i^{\mathbf{x}})^2}{\lambda + \frac{\lambda_p}{2}} = \frac{2\lambda_p^{2r} (\lambda_j - \lambda_i^{\mathbf{x}})^2}{2\lambda + \lambda_p}.$$

9 Hence

$$\left(\sum_{i\in\{1,\ldots,p\}\backslash S} \frac{(\lambda_i^{\mathbf{x}})^2 \|u_\rho\|_K^2}{\lambda + \lambda_i^{\mathbf{x}}} \sum_{j=1}^p \lambda_j^{2r} \langle \phi_j, \phi_i^{\mathbf{x}} \rangle^2 \right)^{1/2}$$
  
$$\leq \|u_\rho\|_K \frac{\sqrt{2}\lambda_p^r}{\sqrt{2\lambda + \lambda_p}} \left(\sum_{i,j} (\lambda_j - \lambda_i^{\mathbf{x}})^2 \langle \phi_j, \phi_i^{\mathbf{x}} \rangle^2 \right)^{1/2}$$
  
$$\leq \|u_\rho\|_K \frac{4\sqrt{2}\kappa^2 \lambda_p^r}{\sqrt{2\lambda + \lambda_p}\sqrt{m}} \log \frac{6}{\delta}.$$

# 2nd Reading

## 16 Z.-C. Guo et al.

1 When r > 1, we have  $\lambda_j^{2r} \le \lambda_1^{2r-2} \lambda_j^2 \le 4\lambda_1^{2r-2} (\lambda_j - \lambda_i^{\mathbf{x}})^2$ , and then

$$\left(\sum_{i\in\{1,\ldots,p\}\backslash \mathcal{S}} \frac{(\lambda_i^{\mathbf{x}})^2 \|u_\rho\|_K^2}{\lambda + \lambda_i^{\mathbf{x}}} \sum_{j=1}^p \lambda_j^{2r} \langle \phi_j, \phi_i^{\mathbf{x}} \rangle^2 \right)^{1/2}$$
  
$$\leq \|u_\rho\|_K \frac{\sqrt{2}\lambda_p \lambda_1^{r-1}}{\sqrt{2\lambda + \lambda_p}} \left(\sum_{i,j} (\lambda_j - \lambda_i^{\mathbf{x}})^2 \langle \phi_j, \phi_i^{\mathbf{x}} \rangle^2 \right)^{1/2}$$
  
$$\leq \frac{4\sqrt{2}\kappa^2 \|u_\rho\|_K \lambda_1^{r-1} \lambda_p}{\sqrt{2\lambda + \lambda_p} \sqrt{m}} \log \frac{6}{\delta}.$$

Now we estimate the last part of (32) which restricts  $i \ge p + 1$  and  $j \le p$ . When  $r \le 1$ , we have

$$\lambda_i^{\mathbf{x}} \lambda_j^{2r} \le (\lambda_i + \|L_K - L_K^{\mathbf{x}}\|_{\mathsf{HS}}) \lambda_j^{2r} \le \left(\lambda_p^{2r-1} + \frac{4\kappa^2}{\sqrt{m}} \lambda_p^{2r-2} \log \frac{6}{\delta}\right) \lambda_j^2,$$

4 and

$$\lambda_j^2 \le 3(\lambda_i^2 + (\lambda_i - \lambda_i^{\mathbf{x}})^2 + (\lambda_j - \lambda_i^{\mathbf{x}})^2).$$

5 Hence

$$\left(\sum_{i=p+1}^{\infty} \frac{(\lambda_{i}^{\mathbf{x}})^{2} \|u_{\rho}\|_{K}^{2}}{\lambda + \lambda_{i}^{\mathbf{x}}} \sum_{j=1}^{p} \lambda_{j}^{2r} \langle \phi_{j}, \phi_{i}^{\mathbf{x}} \rangle^{2} \right)^{1/2} \\
\leq \sqrt{\sup_{x>0} \frac{x}{x+\lambda}} \|u_{\rho}\|_{K} \left(\lambda_{p}^{r-\frac{1}{2}} + \frac{2\kappa}{\sqrt[4]{m}} \lambda_{p}^{r-1} \sqrt{\log \frac{6}{\delta}}\right) \\
\times \sqrt{3} \left(\sum_{i=p+1}^{\infty} \sum_{j=1}^{p} \left(\lambda_{i}^{2} + (\lambda_{i} - \lambda_{i}^{\mathbf{x}})^{2} + (\lambda_{j} - \lambda_{i}^{\mathbf{x}})^{2}\right) \langle \phi_{j}, \phi_{i}^{\mathbf{x}} \rangle^{2} \right)^{1/2} \\
\leq \sqrt{3} \|u_{\rho}\|_{K} \left(\lambda_{p}^{r-\frac{1}{2}} + \frac{2\kappa}{\sqrt[4]{m}} \lambda_{p}^{r-1} \sqrt{\log \frac{6}{\delta}}\right) \left(\left(\sum_{i=p+1}^{\infty} \lambda_{i}^{2}\right)^{1/2} + \frac{4\sqrt{2}\kappa^{2}}{\sqrt{m}} \log \frac{6}{\delta}\right)$$

6 When r > 1, we have

$$\lambda_j^{2r} \le 2^{2r-1} (\lambda_i^{2r} + (\lambda_j - \lambda_i)^{2r})$$
  
$$\le 2^{2r-1} (\lambda_i^{2r} + 2\lambda_j^{2r-1} (\lambda_j - \lambda_i^{\mathbf{x}})^2 + 2\lambda_j^{2r-1} (\lambda_i - \lambda_i^{\mathbf{x}})^2),$$

7 which yields

$$\lambda_i^{\mathbf{x}}\lambda_j^{2r} \le \left(\lambda_p + \frac{4\kappa^2}{\sqrt{m}}\log\frac{6}{\delta}\right) 2^{2r-1} (\lambda_i^{2r} + 2\lambda_1^{2r-1}(\lambda_j - \lambda_i^{\mathbf{x}})^2 + 2\lambda_1^{2r-1}(\lambda_i - \lambda_i^{\mathbf{x}})^2).$$

$$\begin{split} \left(\sum_{i=p+1}^{\infty} \frac{(\lambda_i^{\mathbf{x}})^2 \|u_\rho\|_K^2}{\lambda + \lambda_i^{\mathbf{x}}} \sum_{j=1}^p \lambda_j^{2r} \langle \phi_j, \phi_i^{\mathbf{x}} \rangle^2 \right)^{1/2} \\ &\leq \left(\sqrt{\lambda_p} + \frac{2\kappa}{\sqrt[4]{m}} \sqrt{\log\frac{6}{\delta}}\right) 2^{r-\frac{1}{2}} \|u_\rho\|_K \\ &\times \left(\sum_{i=p+1}^{\infty} \lambda_i^{2r} + 4\lambda_1^{2r-1} \|L_K - L_K^{\mathbf{x}}\|_{\mathrm{HS}}^2\right)^{1/2} \\ &\leq 2^{r-\frac{1}{2}} \|u_\rho\|_K \left(\sqrt{\lambda_p} + \frac{2\kappa}{\sqrt[4]{m}} \sqrt{\log\frac{6}{\delta}}\right) \\ &\times \left(\left(\sum_{i=p+1}^{\infty} \lambda_i^{2r}\right)^{1/2} + 2\lambda_1^{r-\frac{1}{2}} \frac{4\kappa^2}{\sqrt{m}} \log\frac{6}{\delta}\right) \end{split}$$

2 Combining all the above estimates verifies our desired bound.

3 Now we turn to estimate

Therefore

1

$$I_{12} = \left(\sum_{i \in \mathcal{S}} (\lambda + \lambda_i^{\mathbf{x}})^{-1} (G_{\gamma}(\langle f_{\rho}^{\mathbf{z}}, \phi_i^{\mathbf{x}} \rangle) - \langle L_K^{\mathbf{x}} f_{\rho}, \phi_i^{\mathbf{x}} \rangle)^2 \right)^{1/2}.$$

- 4 **Proposition 3.2.** Let  $p \in \mathbb{N}$ . Under regularity condition (7) with some  $0 < r \le \nu_g$ ,
- 5 for  $\mathbf{z} \in U_1 \cap U_2 \cap U_3$ , we have

$$I_{12} \le \sqrt{p} \left( \frac{\gamma}{\sqrt{4\lambda + 2\lambda_p}} + \frac{2\sqrt{2}M}{\sqrt{m}} \sqrt{\log\frac{6m}{\delta}} \right).$$
(33)

6 **Proof.** From the definition (3) of the soft thresholding function  $G_{\gamma}$ , we find

$$|G_{\gamma}(\sigma) - \sigma| \le \frac{\gamma}{2}, \quad \forall \sigma \in \mathbb{R}$$

7 This together with the eigenfunction relation  $L_K^{\mathbf{x}} \phi_i^{\mathbf{x}} = \lambda_i^{\mathbf{x}} \phi_i^{\mathbf{x}}$  implies

$$\begin{aligned} |G_{\gamma}(\langle f_{\rho}^{\mathbf{z}}, \phi_{i}^{\mathbf{x}} \rangle) - \langle L_{K}^{\mathbf{x}} f_{\rho}, \phi_{i}^{\mathbf{x}} \rangle \rangle| &\leq \frac{\gamma}{2} + |\langle f_{\rho}^{\mathbf{z}}, \phi_{i}^{\mathbf{x}} \rangle - \lambda_{i}^{\mathbf{x}} \langle f_{\rho}, \phi_{i}^{\mathbf{x}} \rangle| \\ &= \frac{\gamma}{2} + \sqrt{\lambda_{i}^{\mathbf{x}}} \sqrt{\lambda_{i}^{\mathbf{x}}} \left| \left\langle \frac{1}{\lambda_{i}^{\mathbf{x}}} f_{\rho}^{\mathbf{z}}, \phi_{i}^{\mathbf{x}} \right\rangle - \langle f_{\rho}, \phi_{i}^{\mathbf{x}} \rangle \right|. \end{aligned}$$

8 Recall that for  $i \in S$ , we have  $\lambda_i^{\mathbf{x}} \ge \frac{\lambda_p}{2}$ . It follows that  $(\lambda + \lambda^{\mathbf{x}})^{-1/2} |C_i| (f^{\mathbf{z}} \to f^{\mathbf{x}}) = (I^{\mathbf{x}} f \to f^{\mathbf{x}})$ 

$$\begin{aligned} &(\lambda + \lambda_i^{\mathbf{x}})^{-1/2} |G_{\gamma}(\langle f_{\rho}^{\mathbf{z}}, \phi_i^{\mathbf{x}} \rangle) - \langle L_K^{\mathbf{x}} f_{\rho}, \phi_i^{\mathbf{x}} \rangle| \\ &\leq \frac{\gamma}{2\sqrt{\lambda + \lambda_p/2}} + \sqrt{\lambda_i^{\mathbf{x}}} \left| \left\langle \frac{1}{\lambda_i^{\mathbf{x}}} f_{\rho}^{\mathbf{z}}, \phi_i^{\mathbf{x}} \right\rangle - \langle f_{\rho}, \phi_i^{\mathbf{x}} \right\rangle \end{aligned}$$

9 Then our desired result follows from Lemma 2.1.

 $18 \quad Z.\text{-}C. \ Guo \ et \ al.$ 

## 1 4. Proof of the Main Results

In this section, we present the following general results on sparsity and error analysis of algorithm (6) and then derive the learning rates when the eigenvalues of the integral operator  $L_K$  decay polynomially or exponentially.

**Theorem 4.1.** Suppose that regularity condition (7) holds with some  $0 < r \le \nu_g$ . 6 Let  $p \in \mathbb{N}$  and  $\delta \in (0, 1)$ . If  $\gamma$  satisfies

$$\gamma \geq \begin{cases} C_0 \left( \log \frac{6m}{\delta} \right)^{1+r} \max\left\{ \frac{\lambda_p}{\kappa^2}, \frac{1}{\sqrt{m}} \right\}^{1+r}, & \text{for } 0 < r \leq \frac{1}{2}, \\ C_0 \left( \log \frac{6m}{\delta} \right)^{1+r} \max\left\{ \left( \frac{\lambda_p}{\kappa^2} \right)^{r+\frac{1}{2}}, \frac{1}{\sqrt{m}} \right\} \\ \max\left\{ \frac{\lambda_p}{\kappa^2}, \frac{1}{\sqrt{m}} \right\}^{\frac{1}{2}}, & \text{for } r > \frac{1}{2}, \end{cases}$$

7

9

where 
$$C_0$$
 is the constant given by (24), then with confidence at least  $1 - \delta$ , we have

$$c^i_{\lambda,\gamma,\mathbf{z}} = 0, \quad \forall i \ge p+1$$

8 and the following error bound holds true: for  $0 < r \le 1$ ,

$$\|f_{\mathbf{z}} - f_{\rho}\|_{\rho} \leq 2b \left(\frac{\mathcal{B}_{m,\lambda}}{\sqrt{\lambda}} + 1\right) \left\{ 8\|u_{\rho}\|_{K} \kappa^{2r+2} \left[ \min\left\{\frac{\Lambda_{m,p}}{\sqrt{\lambda}}, \Lambda_{m,p}^{1/2}\right\} \lambda_{p}^{r} + \frac{\lambda_{p}^{r} \lambda^{\min\left\{r-\frac{1}{2},0\right\}}}{(2\lambda+\lambda_{p})^{\min\left\{r,1/2\right\}} \sqrt{m}} + 2^{r} \lambda_{p}^{r-1} \Lambda_{m,p}^{1/2} \left( \left(\sum_{i=p+1}^{\infty} \lambda_{i}^{2}\right)^{1/2} + \frac{8}{\sqrt{m}} \right) \right] \left(\log\frac{6}{\delta}\right)^{\frac{3}{2}} + \sqrt{p} \left(\frac{\gamma}{\sqrt{4\lambda+2\lambda_{p}}} + \frac{2\sqrt{2}M}{\sqrt{m}} \sqrt{\log\frac{6m}{\delta}}\right) \right\} \log\frac{6}{\delta} + C_{r}^{\prime} \left(\frac{\mathcal{B}_{m,\lambda}}{\sqrt{\lambda}} + 1\right)^{2r+1} \lambda^{r+\frac{1}{2}} \left(\log\frac{6}{\delta}\right)^{2r+1},$$
(34)

while for r > 1,

$$\|f_{\mathbf{z}} - f_{\rho}\|_{\rho} \leq 2b \left(\frac{\mathcal{B}_{m,\lambda}}{\sqrt{\lambda}} + 1\right) \left\{ 8\|u_{\rho}\|_{K} \kappa^{2r+2} \left[ \min\left\{\frac{\Lambda_{m,p}}{\sqrt{\lambda}}, \Lambda_{m,p}^{1/2}\right\} \lambda_{p}^{r} + \frac{\lambda_{p}}{\sqrt{2\lambda + \lambda_{p}}\sqrt{m}} + 2^{r} \Lambda_{m,p}^{1/2} \left( \left(\sum_{i=p+1}^{\infty} \lambda_{i}^{2r}\right)^{1/2} + \frac{8}{\sqrt{m}} \right) \right] \left(\log\frac{6}{\delta}\right)^{\frac{3}{2}} \right\}$$

$$+\sqrt{p}\left(\frac{\gamma}{\sqrt{4\lambda+2\lambda_{p}}}+\frac{2\sqrt{2}M}{\sqrt{m}}\sqrt{\log\frac{6m}{\delta}}\right)\right\}\log\frac{6}{\delta}$$
$$+C_{r}\left(\frac{\mathcal{B}_{m,\lambda}}{\sqrt{\lambda}}+1\right)\left(4\kappa^{2}\sqrt{\frac{\lambda}{m}}+\lambda^{r+\frac{1}{2}}\right)\left(\log\frac{6}{\delta}\right)^{2}.$$
(35)

1 Here  $\Lambda_{m,p} = \max\left\{\frac{\lambda_p}{\kappa^2}, \frac{1}{\sqrt{m}}\right\}.$ 

**Proof.** Under the specified choice of 
$$\gamma$$
, by Proposition 2.6, we know that

$$c^i_{\gamma,\lambda,\mathbf{z}} = 0, \quad \forall \, \mathbf{z} \in U_1 \cap U_2, i \ge p+1$$

Putting the bounds for  $I_{11}$  in Proposition 3.1, for  $I_{12}$  in Proposition 3.2, and for  $I_2$ in Proposition 2.9 into error decomposition (27) and applying Lemma 2.8, we see that our stated error bounds hold true for  $\mathbf{z} \in U_1 \cap U_2 \cap U_3$ . But the measure of the set  $U_1 \cap U_2 \cap U_3$  is at least  $1 - \delta$ , so our stated conclusion for the sparsity and error bound holds true, and the proof of the theorem is complete.

8 Theorem 1.5 stated in the introduction is an immediate consequence of the 9 following more general result stated for the more general case when the eigenvalues 10  $\{\lambda_i\}$  of  $L_K$  decay polynomially with different power indices for the upper and lower 11 bounds as

$$D_1 i^{-\alpha_1} \le \lambda_i \le D_2 i^{-\alpha_2}, \quad \forall i \in \mathbb{N}.$$
 (36)

12 **Theorem 4.2.** Assume regularity condition (7) with some  $0 < r \le \nu_g$  and condi-13 tion (36) with  $1 < \alpha_2 \le \alpha_1$ ,  $2\alpha_1(r-1) + 3\alpha_2 - 1 > 0$  and  $D_1, D_2 > 0$ . Let  $0 < \delta < 1$ . 14 If we choose

$$\gamma = C_0 (D_2 / \kappa^2 + 1)^{r+1} \left( \log \frac{6m}{\delta} \right)^{r+1} m^{-\frac{1+r}{\max\{2, 2r+1\}}}$$
(37)

15 and

$$\lambda = \begin{cases} m^{-\frac{1}{2} + \frac{1}{4\alpha_2(1+r)}} & \text{if } 0 < r \le 1/2, \\ \\ m^{-\frac{2\alpha_2(r+1)-1}{2\alpha_2(2r+1)(r+1)}} & \text{if } r > \frac{1}{2}, \end{cases}$$
(38)

where  $C_0$  is the constant given by (24), then with confidence at least  $1 - \delta$  we have

$$c^{i}_{\lambda,\gamma,\mathbf{z}} = 0, \quad \forall \, m^{\frac{1}{\alpha_{2} \max\{2,2r+1\}}} + 1 \le i \le m$$
 (39)

17 and

$$\|f_{\mathbf{z}} - f_{\rho}\|_{\rho} \le C^* \left(\log \frac{6m}{\delta}\right)^{\max\{r+2,\frac{5}{2}\}} m^{-\theta},$$

# **2**nd Reading

 $20 \quad Z.\text{-}C. \ Guo \ et \ al.$ 

1 where

$$\theta = \begin{cases} \frac{3}{4} + \frac{2\alpha_1(r-1)-1}{4\alpha_2} & \text{if } 0 < r \le \frac{1}{2}, \\ \frac{2\alpha_1(r-1)+3\alpha_2-1}{2\alpha_2(2r+1)} & \text{if } \frac{1}{2} < r \le 1, \\ \frac{1}{2} - \frac{1}{2\alpha_2(2r+1)} & \text{if } r > 1, \end{cases}$$

$$(40)$$

2 and the constant  $C^*$  is independent of m or  $\delta$ .

3 **Proof.** We take  $p = \lceil m^{\frac{1}{\max\{2,2r+1\}\alpha_2}} \rceil$ , which implies

$$m^{\frac{1}{\max\{2,2r+1\}\alpha_2}} \le p \le 2m^{\frac{1}{\max\{2,2r+1\}\alpha_2}}$$

4 and by (36) with  $\alpha_1 \ge \alpha_2 > 1$ ,

$$D_1 2^{-\alpha_1} m^{-\frac{\alpha_1}{\alpha_2 \max\{2, 2r+1\}}} \le D_1 p^{-\alpha_1} \le \lambda_p \le D_2 p^{-\alpha_2} \le D_2 m^{-\frac{1}{\max\{2, 2r+1\}}}.$$
 (41)

5 It follows that the choice (37) of  $\gamma$  ensures the condition in Theorem 4.1. Then we 6 can apply Theorem 4.1 and know that with confidence at least  $1 - \delta$ , (39) and the 7 error bounds stated in Theorem 4.1 hold true. What is left is to derive learning rates 8 from these error bounds by simplifying quantities included in the error bounds.

Note that the sum  $\sum_{i=p+1}^{\infty} \lambda_i^2$  in (34) for the case  $r \leq 1$  and the sum  $\sum_{i=p+1}^{\infty} \lambda_i^{2r}$ in (35) for the case r > 1 can be unified as  $\sum_{i=p+1}^{\infty} \lambda_i^{\max\{2,2r\}}$  which can be estimated as

$$\sum_{i=p+1}^{\infty} \lambda_i^{\max\{2,2r\}} \leq \sum_{i=p+1}^{\infty} D_2^{\max\{2,2r\}} i^{-\alpha_2 \max\{2,2r\}}$$
$$\leq D_2^{\max\{2,2r\}} \int_p^{\infty} x^{-\alpha_2 \max\{2,2r\}} dx$$
$$= \frac{D_2^{\max\{2,2r\}} p^{1-\alpha_2 \max\{2,2r\}}}{\alpha_2 \max\{2,2r\} - 1}$$
$$\leq \frac{D_2^{\max\{2,2r\}}}{\alpha_2 \max\{2,2r\} - 1} m^{\frac{1-\alpha_2 \max\{2,2r\}}{\alpha_2 \max\{2,2r+1\}}}$$

12 Concerning the quantity  $\mathcal{B}_{m,\lambda} = \frac{2\kappa}{\sqrt{m}} \left\{ \frac{\kappa}{\sqrt{m\lambda}} + \sqrt{\sum_{\ell=1}^{\infty} \frac{\lambda_{\ell}}{\lambda + \lambda_{\ell}}} \right\}$ , we apply the polynomial decay (36) of  $\{\lambda_i\}_{i=1}^{\infty}$  to get

$$\sum_{\ell=1}^{\infty} \frac{\lambda_{\ell}}{\lambda + \lambda_{\ell}} \le \sum_{\ell=1}^{\infty} \frac{D_2}{D_2 + \lambda \ell^{\alpha_2}} \le \lambda^{-1/\alpha_2} \int_0^\infty \frac{D_2}{D_2 + x^{\alpha_2}} dx \le D_2 \frac{\alpha_2}{\alpha_2 - 1} \lambda^{-1/\alpha_2},$$

14 which implies

$$\frac{\mathcal{B}_{m,\lambda}}{\sqrt{\lambda}} = \frac{2\kappa}{\sqrt{m\lambda}} \left( \frac{\kappa}{\sqrt{m\lambda}} + \sqrt{\sum_{i \in \mathbb{N}} \frac{\lambda_i}{\lambda + \lambda_i}} \right) \le 2\kappa m^{-\frac{1}{2}\lambda^{-\frac{1}{2} - \frac{1}{2\alpha_2}}} \left( \kappa + \sqrt{\frac{D_2\alpha_2}{\alpha_2 - 1}} \right).$$

1 The choice (38) of 
$$\lambda$$
 guarantees that

$$\frac{\mathcal{B}_{m,\lambda}}{\sqrt{\lambda}} + 1 \le C_{\kappa,\alpha_2,D_2},$$

2 where  $C_{\kappa,\alpha_2,D_2}$  is a constant independent of  $\delta$  or m.

Finally we estimate the quantities  $\Lambda_{m,p}$  and  $\min\left\{\frac{\Lambda_{m,p}}{\sqrt{\lambda}}, \Lambda_{m,p}^{\frac{1}{2}}\right\}$  by (41) and (38) and find that the stated learning rates hold true with the power index  $\theta$  given by (40). The proof of the theorem is complete.

6 We are in a position to prove our main result stated in the introduction for the 7 case when the eigenvalues  $\{\lambda_i\}_i$  decay exponentially.

8 **Proof of Theorem 1.7.** It can be easily seen from the exponential decay (13) of 9  $\{\lambda_i\}_{i=1}^{\infty}$  that

$$\sum_{\ell=1}^{\infty} \frac{\lambda_{\ell}}{\lambda + \lambda_{\ell}} \le \sum_{\ell=1}^{\infty} \frac{D_2}{D_2 + \lambda\beta^{\ell}} \le \int_0^{\infty} \frac{D_2}{D_2 + \lambda\beta^x} dx.$$

10 By setting  $\lambda \beta^x = t$ , we have  $x = \log_\beta(\frac{t}{\lambda})$ , and  $dx = \frac{1}{\log \beta} \frac{1}{t} dt$ . It follows that

$$\sum_{\ell=1}^{\infty} \frac{\lambda_{\ell}}{\lambda + \lambda_{\ell}} \leq \frac{1}{\log \beta} \int_{\lambda}^{\infty} \frac{D_2}{(t + D_2)t} dt$$
$$= \frac{1}{\log \beta} \int_{\lambda}^{\infty} \left(\frac{1}{t} - \frac{1}{t + D_2}\right) dt = \frac{1}{\log \beta} \log \left(1 + \frac{D_2}{\lambda}\right).$$

11 Take  $\lambda = D_2 \frac{\log m}{m}$ . We have

$$\sum_{\ell=1}^{\infty} \frac{\lambda_{\ell}}{\lambda + \lambda_{\ell}} \le \frac{1}{\log \beta} \log \left( 1 + \frac{m}{\log m} \right) \le \frac{1}{\log \beta} \log m$$

12 and

$$\frac{\mathcal{B}_{m,\lambda}}{\sqrt{\lambda}} + 1 = \frac{2\kappa}{\sqrt{m\lambda}} \left( \frac{\kappa}{\sqrt{m\lambda}} + \sqrt{\sum_{i \in \mathbb{N}} \frac{\lambda_i}{\lambda + \lambda_i}} \right) + 1 \le \frac{2\kappa}{\sqrt{D_2}} \left( \frac{\kappa}{\sqrt{D_2}} + \frac{1}{\log\beta} \right) + 1.$$
(42)

13

We take  $p = \lceil \frac{\log(m+1)}{\max\{2,2r+1\}\log\beta} \rceil$  to give

$$\frac{\log(m+1)}{\max\{2,2r+1\}\log\beta} \le p \le 1 + \frac{\log(m+1)}{\max\{2,2r+1\}\log\beta}.$$
(43)

14 Moreover, by the eigenvalue exponential decay (13), we have

$$\frac{D_1}{\beta} (2m)^{-\frac{1}{\max\{2,2r+1\}}} \le \lambda_p \le D_2 m^{-\frac{1}{\max\{2,2r+1\}}}.$$
(44)

 $22 \quad Z.\text{-}C. \ Guo \ et \ al.$ 

1 It follows that

i

$$\sum_{i=p+1}^{\infty} \lambda_{i}^{\max\{2r,2\}} \leq D_{2}^{\max\{2r,2\}} \sum_{i=p+1}^{\infty} \beta^{-i\max\{2r,2\}} = D_{2}^{\max\{2r,2\}} \frac{\beta^{-(p+1)\max\{2r,2\}}}{1 - \beta^{-\max\{2r,2\}}}$$
$$= D_{2}^{\max\{2r,2\}} \frac{\beta^{-p\max\{2r,2\}}}{\beta^{\max\{2r,2\}} - 1} \leq \frac{D_{2}^{\max\{2r,2\}}}{\beta^{\max\{2r,2\}} - 1} m^{-\frac{\max\{2r,2\}}{\max\{2,2r+1\}}}.$$
(45)

Finally we estimate the quantities  $\Lambda_{m,p}$  and  $\min\left\{\frac{\Lambda_{m,p}}{\sqrt{\lambda}}, \Lambda_{m,p}^{\frac{1}{2}}\right\}$  by (44) and the choice  $\lambda = D_2 \frac{\log m}{m}$  as

$$\Lambda_{m,p} = \max\left\{\frac{\lambda_p}{\kappa^2}, \frac{1}{\sqrt{m}}\right\} \le \left(\frac{D_2}{\kappa^2 + 1}\right) m^{-\frac{1}{\max\{2, 2r+1\}}},$$
$$\min\left\{\frac{\Lambda_{m,p}}{\sqrt{\lambda}}, \Lambda_{m,p}^{\frac{1}{2}}\right\} \le \left(\frac{D_2}{\kappa^2 + 1}\right) m^{-\frac{1}{2\max\{2, 2r+1\}}}.$$

4 Combining the above estimates and Theorem 4.1, we find that the stated learning
5 rates hold true. The proof of the theorem is complete. □
